

Security Ecosystem Consolidation

Protecting Data Anywhere All The Time

Challenge

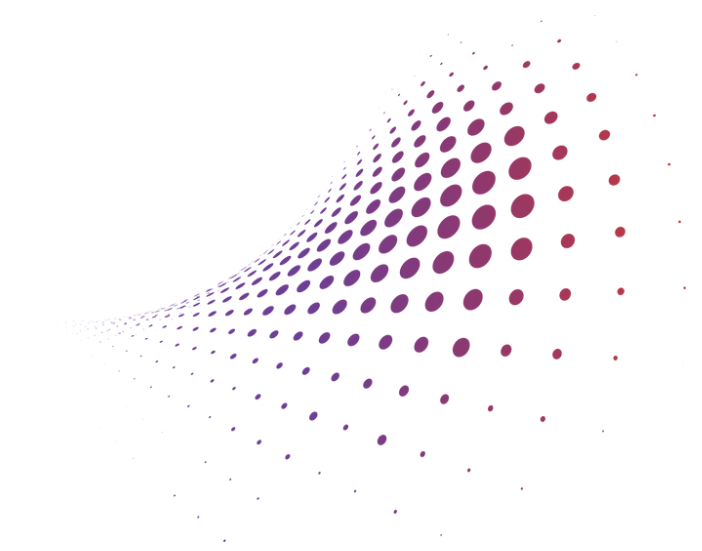

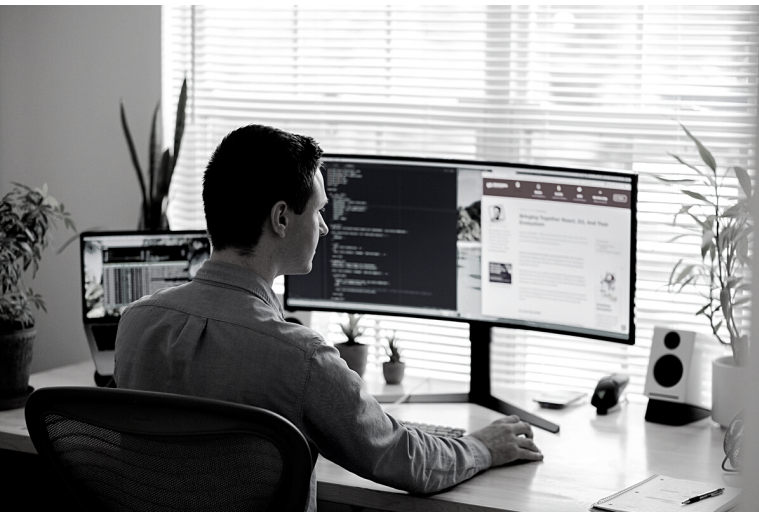

- IT security organizations struggle to manage countless security point solutions and disparate management platforms.
- Each point solution can include user management, access configuration, and monitoring of tasks.
- As more point solutions are integrated into the IT ecosystem, gathering meaningful analytics and identifying possible threats becomes more challenging.

Solution

- Sotero integrates with applications both on and off-site to place security controls on the data itself, reducing the need for multiple solutions to protect the perimeter.
- Sotero protection sits between end users and assets, allowing cloud and on-premises infrastructure monitoring.
- Sotero single-pane of glass visibility simplifies access management and monitoring, reducing staff load.
- Automated tracking of access requests and utilization combined with anomaly detection driven by advanced machine learning catches access misuse, automatically blocking attacks by internal and external threats.

Benefits

- A single solution focused on the data protects sensitive elements no matter where they are located, allowing for the secure usage of cloud technologies, including SaaS applications.
- A single unified solution consolidates data protection management, access configuration, and monitoring to one location.
- Allows organizations to save money and embrace the benefits of scalable cloud environments
- In-depth visibility integrates with existing SIEM or IaaS and utilizes a single user interface for meaningful analytics related to your organization's information security.
- It easily integrates with applications requiring no server-side software and no code to rapidly onboard into your infrastructure.
- Seamless implementation protects data without any impact on the user experience, allowing them to continue their daily work without being aware of the tracking and protection occurring in the background.

About Sotero

Sotero is the global innovator and leader in revolutionary data security. Sotero is a cloud-native data protection platform that protects ALL cloud data types, applications, and stores from catastrophic cyber attacks. Sotero protects your data in the cloud with no costly, time-consuming deployment or downtime. Advanced encryption and real-time machine learning techniques allow organizations to solve for insider and outsider threats while meeting compliance requirements with actionable audit logs. The platform enables fast deployments that enable data to be shared securely and used with confidence. With point and click set-up, Sotero's data security platform is easy to deploy and manage with no impact on user experience. Organizations can now be protected in a matter of days, not weeks or months.
